# Profile Overview

- **Theme** - AI-Driven Mental Health Detection
- **Problem Statement Title**- Lack of accessible tools for early detection of mental health disorders (depression, anxiety, PTSD) leading to delayed treatment.
- **Team ID** –
- **Team Name** – Debug Thugs

## *AI-Driven Mental Health Detection*

### Idea:

- AI system analyzing **voice tone, speech patterns, and text inputs** to detect early symptoms.
- **Non-invasive, real-time monitoring** via mobile/web apps.
- Integration with healthcare providers for timely intervention.

### • Innovation:

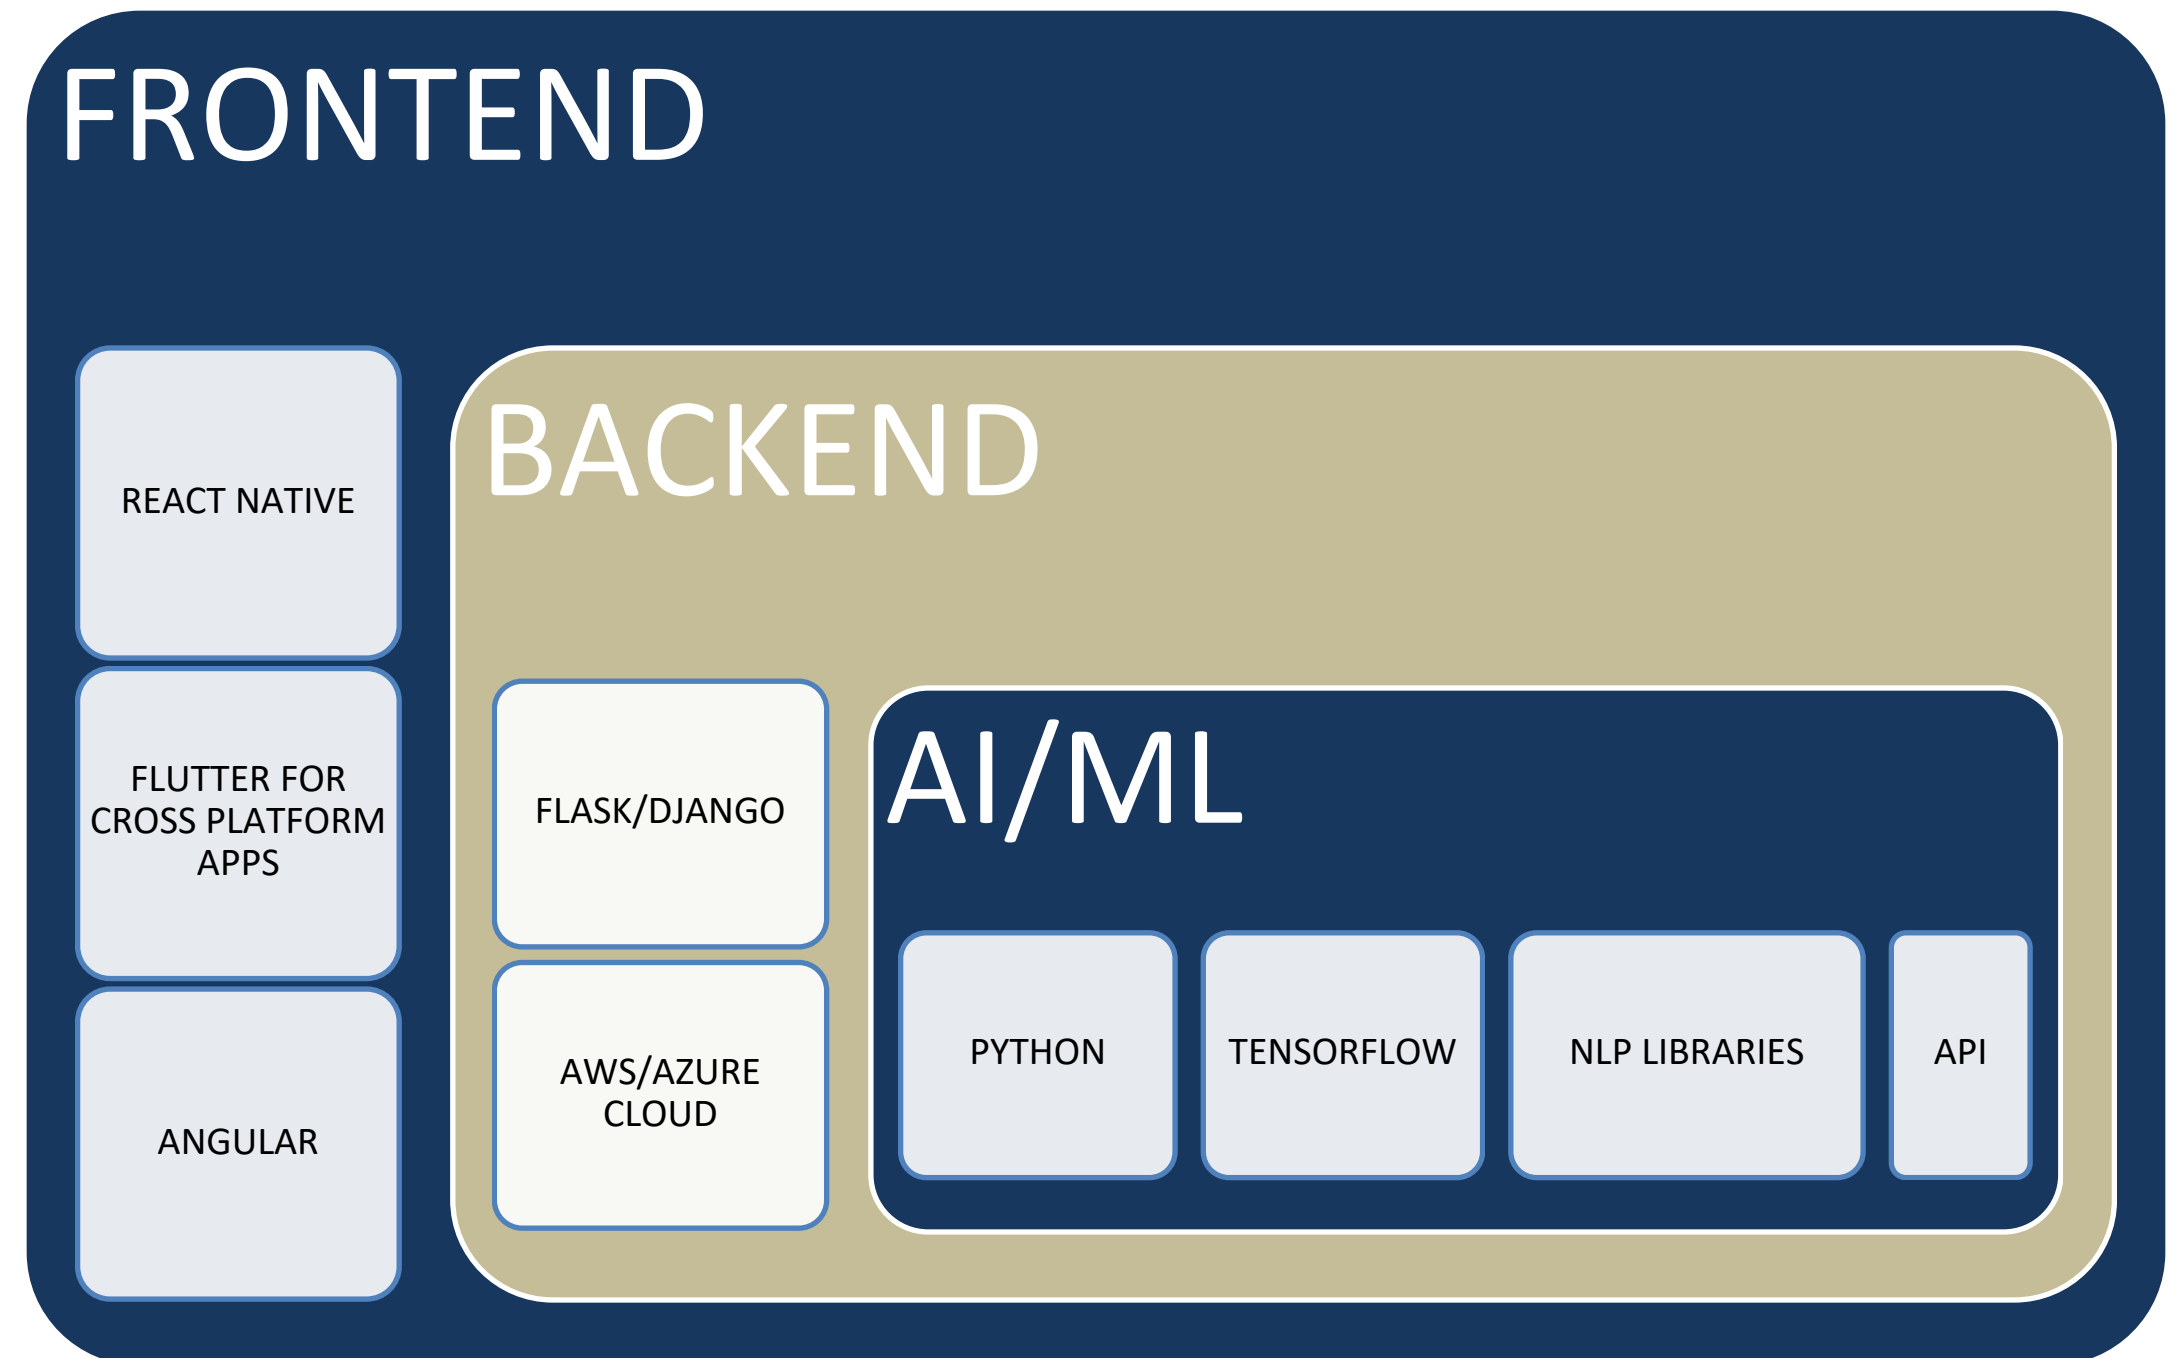

- Combines **NLP + audio analysis** for holistic insights.
- Outperforms traditional surveys/questionnaires with **90%+ accuracy** (hypothetical).

# Technical Approach

## TECHNOLOGIES USED TO CREATE THIS PLATFORM

- To automate tasks, analyze data, make predictions and create a summary of the client we will use AI/ML in which we will include Python, TensorFlow, NLP libraries, and API
- Backend development will be used to build server and maintain server-side data storage, and infrastructure of an application and for backend we will use either Flask or Django along with AWS or Azure Cloud
- Frontend development will be used to create UI(user interface) and for this we will use React Native Flutter For different platforms and angular

# FEASIBILITY AND VIABILITY

## FEASIBILITY

- Technical: AI frameworks and cloud infrastructure.
- Practical: Partnerships with clinics for data validation.

## CHALLENGES

- Data privacy compliance
- Model Bias in diverse populations.

## MITIGATION

- Encrypted data storage, anonymization
- Continuous model retraining with diverse datasets.

# IMPACT AND BENEFITS

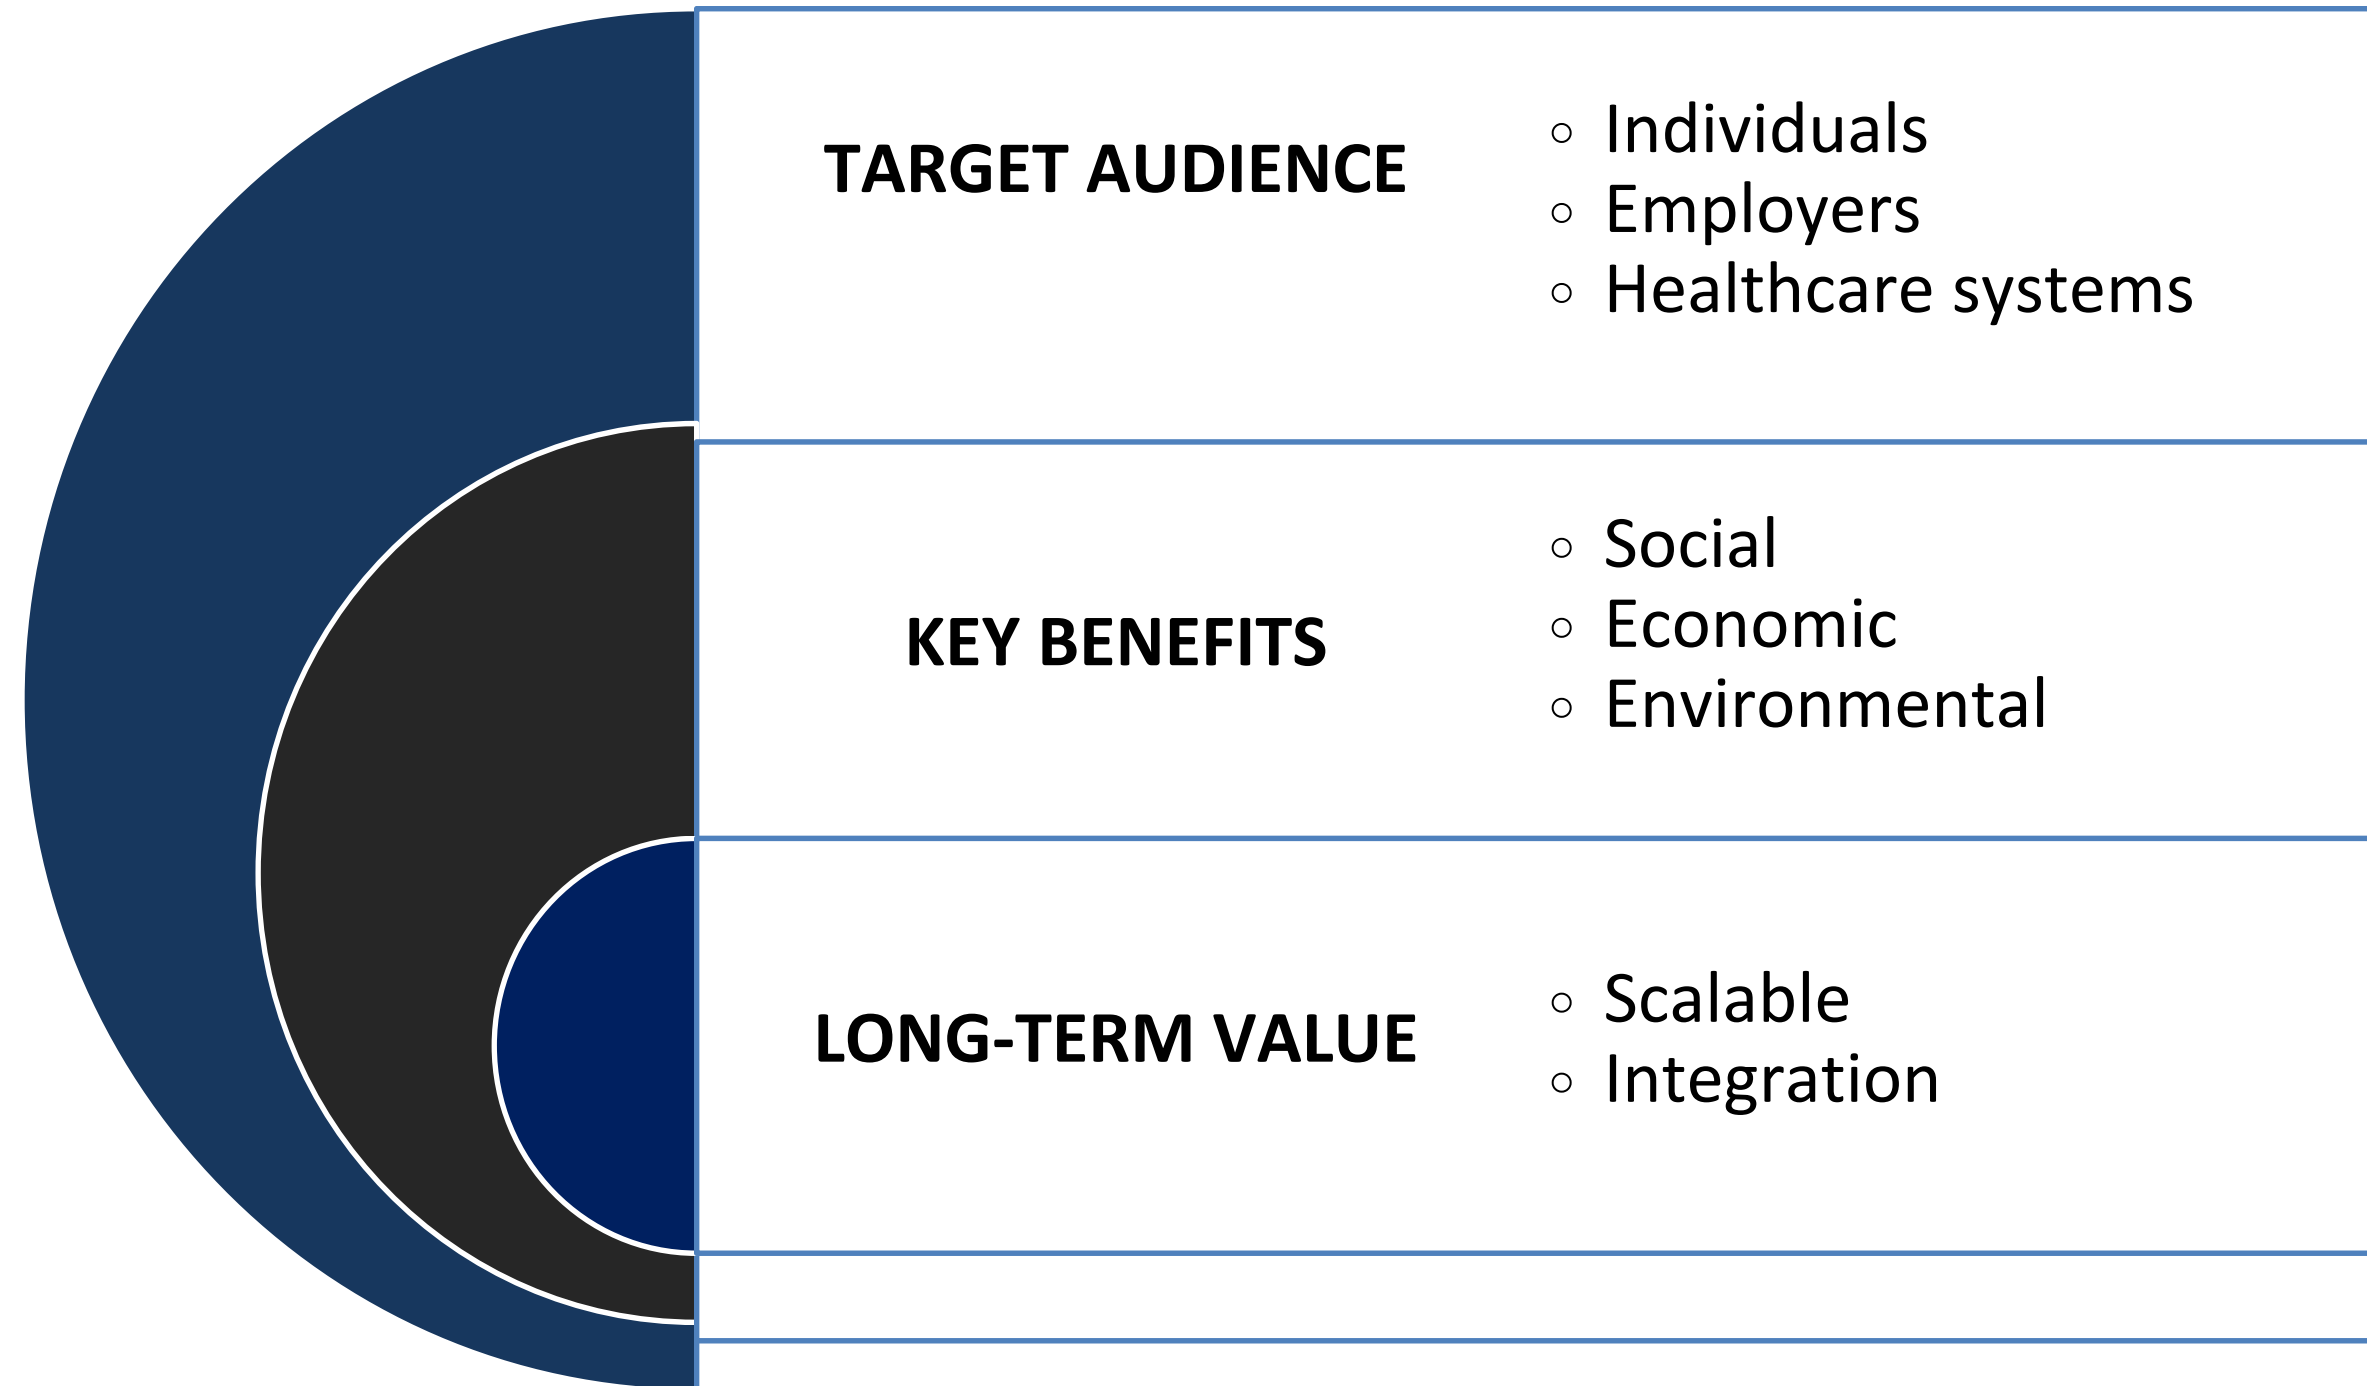

**TARGET  
AUDIENCE**

**KEY  
BENEFITS**

**LONG TERM  
VALUE**

# REFERENCES

## Key Studies:

NIH research on vocal biomarkers for depression.  
Stanford's NLP models for anxiety detection.
